* Never try to reduce the hernia in Adult as it.

* pt asymptomatic → watchfull waiting

x we treat according to guideline (treat or not)

x femoral hernia more pron to incarcerated? small opening

x No significant difference in recurrence btw *laproscopic or open. (laproscopic less hospitalization)

do we use a mesh?

* Complication :-

① clean (just incarceration) → we use a mesh

② clean-contaminated (strangulation but we don't need bowel resection) → synthetic monofilaments

③ dirty infected } don't use → risk of infection

④ contaminated } a mesh

tension free method → use a mesh

* Adult hernia NEVER do reduction to it →

mal practice ← لا يجوز ان نأخذ hernia و نضعه في مكانه

lap recurrence is less than open & laproscopy *
open deh // recurrence after open → laproscopy

when we diagnose diaphragmatic hernia? Antenatal.
